*SKF bearing maintenance handbook* ISBN 978-91-978966-4-1

Self-aligning ball bearings have two rows of balls, a common sphered raceway in the outer ring and two deep uninterrupted raceway grooves in the inner ring. They are available open or sealed. The bearings are insensitive to angular misalignment of the shaft relative to the housing ([fig. 1](#)), which can be caused, for example, by shaft deflection.

## Bearing features

- **Accommodate static and dynamic misalignment**

The bearings are self-aligning like spherical roller bearings or CARB bearings.

- **Excellent high-speed performance**

Self-aligning ball bearings generate less friction than any other type of rolling bearing, which enables them to run cooler even at high speeds.

- **Minimum maintenance**

Because of low heat generation, the bearing temperature is lower, leading to extended bearing life and maintenance intervals.

- **Low friction**

Very loose conformity between balls and outer ring keeps friction and frictional heat at low levels.

- **Excellent light load performance**

Self-aligning ball bearings have low minimum load requirements.

- **Low noise**

Self-aligning ball bearings can reduce noise and vibration levels, for example, in fans.

**Fig. 1**

**Self-aligning ball bearing accommodates misalignment**

# Designs and variants

## SKF standard assortment

SKF self-aligning ball bearing variants are:

- open (fig. 2)
  - with cylindrical bore
  - with tapered bore, e.g. for use with adapter sleeves (fig. 3)
  - with extended inner ring (fig. 4)
- sealed (fig. 5)
  - with cylindrical bore
  - with tapered bore, e.g. for use with adapter sleeves

## Sealed bearings

Sealed bearings equipped with contact seals on both sides (fig. 6) are available:

- in the 22 and 23 series
- with bore diameter  $10 \leq d \leq 70$  mm
- with seals made of sheet steel reinforced NBR (oil and wear-resistant, designation suffix -2RS1)

Permissible angular misalignment of sealed bearings is slightly reduced compared to open design bearings.

## 4 Self-aligning ball bearings

### Greases for capped bearings

Bearings sealed on both sides are lubricated for the life of the bearing and are virtually maintenance-free. They are filled with one of the following standard greases, which have good corrosion-inhibiting properties (table 1):

- $D \leq 62 \rightarrow$  MT47 grease
- $D > 62 \rightarrow$  MT33 grease

### Grease life for capped bearings

- is presented as  $L_{10}$ , i.e. the time period at the end of which 90% of the bearings are still reliably lubricated
- depends on the operating temperature and the  $nd_m$  value (diagram 1)

The grease life specified in diagram 1 is valid for the following combination of operating conditions:

- horizontal shaft
- inner ring rotation
- light load ( $P \leq 0,05 C$ )
- operating temperature within the green temperature zone of the grease (table 1)
- stationary machine
- low vibration levels

Where the operating conditions differ, the grease life obtained from the diagram should be adjusted:

- vertical shafts  $\rightarrow$  50% of the obtained value
- heavier loads ( $P > 0,05 C$ )  $\rightarrow$  apply reduction factor (table 2)

When sealed bearings must operate under certain extreme conditions, such as very high speeds or high temperatures, grease may appear on the capping diameter. For bearing arrangements where this would be detrimental, appropriate actions should be taken. For additional information, contact the SKF application engineering service.

## Large self-aligning ball bearings

- are available in the 130 and 139 series
- are equipped with an annular groove in the outer ring and (fig. 7):
  - three equally-spaced lubrication holes in the outer ring
  - six equally-spaced lubrication holes in the inner ring
- can be used in any application where low friction is preferred over high load carrying capacity (e.g. in the paper industry)

## Bearings with an extended inner ring

- are (fig. 8) designed for less demanding applications that use commercial grade shafting
- have a special bore tolerance, class JS7 (table 3), that facilitates mounting and dismounting
- are located axially on the shaft by means of a slot at one end of the inner ring that engages a pin or shoulder screw (fig. 9) fitted to the shaft

This also prevents the shaft from spinning in the bearing bore.

| Suffix    | –                                                                                 | –                                                                                 | TN9                                                                               | M<br>(no designation suffix when d ≥ 150 mm)                                        | M<br>(no designation suffix when d ≥ 150 mm)                                        |

For bearings with non-standard cages, contact SKF.

Cages

Depending on their series and size, SKF self-aligning ball bearings are fitted with one of the cages shown in [table 4](#).  
When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For additional information about the suitability of cages, refer to *Cages*, [page 187](#).

Table 5

Permissible angular misalignment

| Bearings/series         | Misalignment<br>$\alpha$ |
|-------------------------|--------------------------|
| –                       | °                        |

## Temperature limits

The permissible operating temperature for self-aligning ball bearings can be limited by:

- the dimensional stability of the bearing rings and balls
- the cage
- the seals
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

### Bearing rings and balls

SKF self-aligning ball bearings are heat stabilized up to 120 °C (250 °F).

### Cages

Steel or brass cages can be used at the same operating temperatures as the bearing rings and balls. For temperature limits of polymer cages, refer to *Polymer cages*, [page 188](#).

### Seals

The permissible operating temperature for NBR seals is –40 to +100 °C (–40 to +210 °F). Temperatures up to 120 °C (250 °F) can be tolerated for brief periods.

Typically, temperature peaks are at the seal lip.

### Lubricants

Temperature limits for the greases used in sealed SKF self-aligning ball bearings are provided in [table 1, page 441](#). For temperature limits of other SKF greases, refer to *Selecting a suitable SKF grease*, [page 116](#).

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept ([page 117](#)).

# Permissible speed

The speed ratings in the **product tables** indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, [page 130](#).

## Design considerations

### Ball protrusion

The balls of some bearings in the 12 and 13 series protrude from the side faces of the bearing ([fig. 10](#)). The values of the protrusion are listed in the [product table](#), [page 457](#), and should be considered when designing components in close proximity to the bearing.

# Bearings on sleeves

Self-aligning ball bearings with a tapered bore can be mounted with:

- an adapter sleeve on plain or stepped shafts ([fig. 11](#))
- a withdrawal sleeve on stepped shafts ([fig. 12](#))

Adapter sleeves are supplied complete with a locking device.

For appropriate SKF adapter sleeves, refer to the [product table](#), [page 458](#).

When using sealed bearings, make sure appropriate SKF adapter sleeve assemblies (e.g. E design sleeve, refer to the [product table](#)) are used to prevent the locking device from interfering with the seal ([fig. 13](#)). Alternatively, use a spacer ring between the bearing and the lock washer.

For additional information

- *Adapter sleeves*, [page 1065](#)
- *Withdrawal sleeves*, [page 1087](#)

## Bearings with an extended inner ring

When two of these bearings are used to support a shaft, to locate the shaft axially the inner ring slots must be arranged facing towards or away from each other ([fig. 9](#), [page 441](#)).

Fig. 10

Protrusion of balls from side faces

Fig. 11

On a plain shaft

On a stepped shaft

# Appropriate bearing housings

Appropriate SKF bearing housings are available in a variety of designs and sizes for a wide range of applications. The designs include:

- SNL, SE plummer (pillow) block housings in the 2, 3, 5 and 6 series
- FNL flanged housings
- SAF plummer (pillow) block housings for inch shafts

Additional information about SKF bearing housings is available online at [skf.com/housings](http://skf.com/housings).

## Mounting

### Mounting bearings with a cylindrical bore

Refer to *Mounting bearings with a cylindrical bore*, [page 201](#).

### Mounting bearings with a tapered bore

Bearings with a tapered bore are mounted with an interference fit, by using one of the following methods:

- 1 Feeling the clearance reduction by turning and swivelling the outer ring (fig. 14)**
  - This method is valid for bearings with Normal radial clearance (not for sealed bearings).
  - The clearance reduction in the bearing is sufficient when the outer ring can be turned easily, but a slight resistance is felt when it is swivelled out.
- 2 Measuring the lock nut tightening angle (table 7, page 448)**
- 3 Measuring the axial drive-up (table 7)**
- 4 Applying the SKF Drive-up Method**

For bearings with  $d \geq 50$  mm, SKF recommends using the SKF Drive-up Method. This is a fast, reliable and safe method to determine the appropriate interference fit. Additional information is available online at [skf.com/drive-up](http://skf.com/drive-up).

For additional information about these mounting methods, refer to *Mounting bearings with a tapered bore*, [page 203](#), or the *SKF bearing maintenance handbook*.

SKF thrust ball bearings (fig. 1) are manufactured as single direction or double direction thrust ball bearings. They are designed to accommodate axial loads only and must not be subjected to any radial load.

### Bearing features

- **Separable and interchangeable**  
The separable components of SKF thrust ball bearings are interchangeable (fig. 2). This facilitates mounting and dismounting, and maintenance inspections.
- **Initial misalignment**  
Bearings with sphered housing washer(s) (fig. 3) can accommodate initial misalignment.
- **Interference fit**  
Shaft washers have a ground bore to enable an interference fit. The bore of the housing washer is turned and always larger than the shaft washer bore.

# Designs and variants

## Single direction thrust ball bearings

- consist of a shaft washer, a housing washer and a ball and cage assembly (fig. 4)
- can accommodate axial loads and locate a shaft axially, in one direction only

## Double direction thrust ball bearings

- consist of one shaft washer, two housing washers and two ball and cage assemblies (fig. 5)
- The housing washers and ball and cage assemblies of double direction bearings are identical to those used in single direction bearings.
- can accommodate axial loads and locate a shaft axially, in both directions

# Bearings with sphered housing washers

- can accommodate initial misalignment
- are available in both single (fig. 6) and double direction designs
- can be used together with a sphered seat washer adjacent to the housing washer (fig. 7) or adjacent to a machine component manufactured with a sphered surface

Appropriate sphered seat washers must be ordered separately (product tables, page 482, and page 490). Depending on the bearing series, they have the basic designation U 2, U 3 or U 4 followed by a two-digit number, which identifies the size, e.g. sphered seat washer U 320 for bearing 53320.

## Cages

SKF thrust ball bearings are fitted with one of the cages shown in table 1.  
For additional information about the suitability of cages , refer to Cages, page 187.

| Table 1                        |                                                                                   |                                                                                     |                                                                                     |

# Temperature limits

The permissible operating temperature for thrust ball bearings can be limited by:

- the dimensional stability of the bearing washers and balls
- the cage
- the seat washer(s)
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

## Bearing washers and balls

Depending on their size, washers and balls of SKF thrust ball bearings are heat stabilized up to:

- 125 °C (260 °F) where  $d \leq 300$  mm
- 150 °C (300 °F) where  $d > 300$  mm

## Cages

Steel and brass cages can be used at the same operating temperatures as the bearing washers and balls.

## Seat washers

Seat washers are made of steel and can be used at the same operating temperatures as the bearing washers and balls.

## Lubricants

For temperature limits of SKF greases, refer to *Selecting a suitable SKF grease*, [page 116](#).

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept ([page 117](#)).

# Permissible speed

The speed ratings in the [product tables](#) indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, [page 130](#).

# Mounting

Where mounting a single direction thrust ball bearing, it is important to differentiate between the shaft washer and the housing washer. The bore of the shaft washer is ground and always smaller than the bore of the housing washer. The shaft washer should always be placed against a shaft step or fixed shaft component.

# Designation system

## 5.1 Single direction thrust ball bearings

d 3 – 35 mm

| Principal dimensions |    |     | Basic load ratings |                | Fatigue load limit | Minimum load factor | Speed ratings   |                | Mass   | Designation |

SKF bearing maintenance  
handbook ISBN 978-91-978966-4-1

SKF cylindrical roller bearings are available in many designs, series and sizes. The major design differences between the cylindrical roller bearings presented in this catalogue are in:

- the number of roller rows (one or two)
- the type of cage (with, without or special designs)
  - Bearings with a cage can accommodate heavy radial loads and peak loads, rapid accelerations and high speeds.
  - Full complement bearings (without cage) incorporate a maximum number of rollers and are therefore suitable for very heavy radial loads at moderate speeds.
  - SKF high-capacity cylindrical roller bearings combine the high load carrying capacity of a full complement bearing with the high speed capability of a bearing with cage.
- the configuration of the inner and outer ring flanges (position and number of guide flanges, [fig. 1](#))

## Bearing features

- **High load carrying capacity**
- **High stiffness**
- **Accommodate axial displacement** ([fig. 2](#))  
Except for bearings with flanges on both the inner and outer rings.
- **Low friction**  
The open flange design ([fig. 3](#)), together with the roller end design and surface finish, promote lubricant film formation resulting in lower friction and higher axial load carrying capacity.
- **Long service life**  
The logarithmic roller profile reduces edge stresses at the roller/raceway contact ([fig. 4](#)) and sensitivity to misalignment and shaft deflection.

Fig. 1

Configuration examples guide flanges

- **Enhanced operational reliability**

The surface finish on the contact surfaces of the rollers and raceways supports the formation of a hydrodynamic lubricant film.

- **Separable and interchangeable**

The separable components of SKF cylindrical roller bearings are interchangeable (fig. 5). This facilitates mounting and dismounting, as well as maintenance inspections.

In addition to the cylindrical roller bearings presented in this catalogue, SKF supplies cylindrical roller bearings for special application requirements. This assortment includes:

- Double row cylindrical roller bearings → [skf.com/bearings](https://skf.com/bearings)
- Four-row cylindrical roller bearings → [skf.com/bearings](https://skf.com/bearings)
- Split cylindrical roller bearings → [skf.com/bearings](https://skf.com/bearings)
- Super-precision bearings → [skf.com/super-precision](https://skf.com/super-precision)
- Backing bearings → [skf.com/bearings](https://skf.com/bearings)
- Indexing roller units → [skf.com/bearings](https://skf.com/bearings)
- Cylindrical roller bearings and bearing units for railway applications → contact SKF

# Designs and variants

## Single row cylindrical roller bearings

The major design differences between the single row cylindrical roller bearings presented in this catalogue are in:

- the cage design and material
- the configuration of the inner and outer ring flanges

SKF inch bearings (CRL and CRM series, [skf.com/go/17000-6-1](https://skf.com/go/17000-6-1)), which are not presented in this catalogue, conform to the metric N design (fig. 6). They are mainly used in the aftermarket and, therefore, SKF recommends not to use these bearings for new bearing arrangement designs.

### Common designs

The most common designs of single row cylindrical roller bearings are shown in fig. 6.

#### NU design bearings

- have two integral flanges on the outer ring and no flanges on the inner ring
- can accommodate axial displacement of the shaft relative to the housing in both directions
- can be used together with an appropriate angle ring to stabilize the bearing in the axial direction (fig. 7, *Appropriate angle rings*)

#### N design bearings

- have two integral flanges on the inner ring and no flanges on the outer ring
- can accommodate axial displacement of the shaft relative to the housing in both directions

#### NJ design bearings

- have two integral flanges on the outer ring and one on the inner ring
- can accommodate axial displacement of the shaft relative to the housing in one direction only
- are used to locate the shaft axially in one direction
- can be used together with an appropriate angle ring to stabilize the bearing in the other axial direction (fig. 8, *Appropriate angle rings*)

#### NUP design bearings

- have two integral flanges on the outer ring and one integral flange and one non-integral flange, i.e. a loose flange ring, on the inner ring
- are used to locate the shaft axially in both directions

### Appropriate angle rings (thrust collars)

- are used with NU design bearings to locate the shaft axially in one direction (fig. 7)
- Angle rings should not be used on both sides of NU design bearings as this can lead to axial clamping of the rollers.
- are used with NJ design bearings to locate the shaft axially in both directions (fig. 8)
- are made of carbon chromium steel
- are hardened and ground
- have a maximum axial run-out that is in accordance with the Normal tolerance class for the appropriate bearing
- are identified by the series designation HJ followed by the appropriate bearing dimension series and size
- are available as listed in the [product table](#), [page 517](#)
- must be ordered separately

Reasons to design angle rings into a bearing arrangement include:

- no NJ or NUP design locating bearings in the product range
- to provide an extend inner ring seat for heavily loaded bearings in the locating position:
  - full width inner ring seat of NJ design bearings with an HJ angle ring compared to NUP design bearings having a shorter inner ring and a loose flange
- to simplify design or mounting procedures

## Other designs

For the assortment of other design bearings (fig. 9), visit [skf.com/go/17000-6-1](https://skf.com/go/17000-6-1).

### NUB design bearings

- have two integral flanges on the outer ring and no flanges on the inner ring that is extended on both sides
- can accommodate axial displacement of the shaft relative to the housing in both directions

### NJP design bearings

- have two integral flanges on the outer ring and one non-integral flange, i.e. a loose flange ring, on the inner ring
- are used to locate the shaft axially in one direction

### NF design bearings

- have two integral flanges on the inner ring and one integral flange on the outer ring
- are used to locate the shaft axially in one direction

## NP design bearings

- have two integral flanges on the inner ring and one integral flange and one non-integral flange, i.e. a loose flange ring, on the outer ring
- are used to locate the shaft axially in both directions

## Other variants

### Bearings without an inner or outer ring

- are available based on:
  - NU design bearings without an inner ring (RNU series, fig. 10)
    - enable the shaft diameter to be larger to provide a stronger, stiffer shaft
    - provide inside diameter  $F_w$  tolerance limits to be within F6Ⓔ when the rollers are in contact with the outer ring raceway
  - N design bearings without an outer ring (RN series, fig. 11)
- can accommodate axial displacement of the shaft relative to the housing, limited by the width of the raceway:
  - on the shaft for RNU bearings
  - in the housing for RN bearings
- are typically used in applications where hardened and ground raceways can be machined on the shaft or in the housing (*Raceways on shafts and in housings*, page 179)

## 6 Cylindrical roller bearings

### Bearings with a tapered bore

- are available with a 1:12 tapered bore (designation suffix K, [fig. 12](#))
- have radial internal clearance greater than corresponding bearings with a cylindrical bore

### Bearings with a snap ring groove in the outer ring

- are identified by the designation suffix N ([fig. 13](#))
- can be axially located in the housing by a snap ring:
  - to save space
  - to reduce mounting time

### Bearings with locating slots in the outer ring

- are available with one or two locating slots (designation suffix N1 or N2, [fig. 14](#))
  - The two locating slots are positioned 180° apart.
- can be used to prevent the outer ring from turning where it must be mounted with a loose fit

## High-capacity cylindrical roller bearings

SKF high-capacity cylindrical roller bearings ([fig. 15](#)) are designed for applications such as industrial gearboxes, wind turbine gearboxes and mining equipment.

The cage bars are displaced relative to the roller pitch diameter to enable the rollers to be placed closer to each other, creating room for additional rollers ([fig. 16](#)) and thereby increasing load carrying capacity and radial stiffness.

The black oxide coating of rings and rollers (designation suffix L4B) contributes to extended service life by improving:

- smearing damage resistance
- running-in properties and reducing friction
- performance under poor lubrication conditions
- chemical resistance (from aggressive oil additives)
- corrosion resistance

SKF high-capacity cylindrical roller bearings are available in three different main designs and some variants.

Fig. 16

Roller distances

Roller distance of a standard bearing with cage (cage not shown)

High-capacity bearing with inner ring centred cage

Separable high-capacity bearing with inner ring raceway centred cage

High-capacity bearing with outer ring centred cage

## Bearings with an inner ring centred cage

- are identified by the series designation NCF .. ECJB (fig. 17)
- are used to locate the shaft axially in one direction and eventually to accommodate axial displacement of the shaft relative to the housing in the opposite direction
- can be supplied without an outer ring (RN .. ECJB series, fig. 17), where the outer raceway is integrated into the application (*Raceways on shafts and in housings*, page 179)

## Bearings with an outer ring centred cage

- are identified by the series designation NJF .. ECJA (fig. 18)
- for some sizes, contain more rollers than same-sized bearings with an inner ring centred cage
- are used to locate the shaft axially in one direction and eventually to accommodate axial displacement of the shaft relative to the housing in the opposite direction
- can be supplied without an inner ring (RNU .. ECJA series, fig. 18), where the inner raceway is integrated into the application (*Raceways on shafts and in housings*, page 179)

## Separable bearings with an inner ring raceway centred cage

- are identified by the series designation NUH .. ECMH (fig. 19)
- can accommodate axial displacement of the shaft relative to the housing in both directions
- can be separated (outer ring with the roller and cage assembly from the inner ring), which simplifies mounting and dismounting, particularly where load conditions require both rings to have an interference fit

## Double row bearings

- are available on request

## Single row full complement cylindrical roller bearings

SKF single row full complement cylindrical roller bearings are suitable for very heavy radial loads and provide increased radial stiffness.

The basic SKF assortment of single row full complement cylindrical roller bearings provided in this catalogue includes NCF and NJG design bearings (fig. 20). They are used to locate the shaft axially in one direction and eventually to accommodate axial displacement of the shaft relative to the housing in the opposite direction.

### NCF design bearings

- have two integral flanges on the inner ring and one on the outer ring
- have a retaining ring in the outer ring, on the side opposite the integral flange, to hold the bearing together

The retaining ring should not be loaded axially during operation.

### NJG design bearings

- comprise the heavy 23 dimension series
- are intended for very heavily loaded, low-speed applications
- have two integral flanges on the outer ring and one on the inner ring
- have a self-retaining roller complement

Therefore, the outer ring with the roller complement can be separated from the inner ring without having to take special precautions to prevent the rollers from falling out (fig. 21). This simplifies mounting and dismounting.

## Double row full complement cylindrical roller bearings

SKF double row full complement cylindrical roller bearings are, because of their second row of rollers, suitable for very heavy radial loads and provide increased radial stiffness.

The basic SKF assortment provided in this catalogue includes (fig. 22):

- three different designs of open bearings:
  - NNCL design
  - NNCF design
  - NNC design
- NNF design sealed bearings

SKF double row full complement cylindrical roller bearings are non-separable and have an annular groove and lubrication holes in the outer ring to facilitate lubrication. NNF design bearings have additional lubrication holes in the inner ring.

Fig. 20

Single row full complement bearings

Fig. 21

Self-retaining roller complement

Fig. 22

Double row full complement bearings

## NNCL design bearings

- have three integral flanges on the inner ring and no flanges on the outer ring
- have a retaining ring in the outer ring between the roller rows to hold the bearing together

The retaining ring should not be loaded axially during operation.

- can accommodate axial displacement of the shaft relative to the housing in both directions

## NNCF design bearings

- have three integral flanges on the inner ring and one on the outer ring
- have a retaining ring in the outer ring, on the side opposite the integral flange, to hold the bearing together

The retaining ring should not be loaded axially during operation.

- are used to locate the shaft axially in one direction and eventually to accommodate axial displacement of the shaft relative to the housing in the opposite direction

## NNC design bearings

- have the same inner ring as NNCL and NNCF design bearings
- have a two-piece outer ring:
  - held together by retaining elements, which should never be loaded axially
  - consisting of two identical outer ring parts with one integral flange on each
- are used to locate the shaft axially in both directions

Alternative NNC design bearings may consist of a one-piece outer ring with one integral flange and a flange ring.

## NNF design sealed bearings

- comprise the 50 and 3194.. series
- have a two-piece inner ring:
  - held together by a retaining ring
  - with three integral flanges
- have one integral central flange on the outer ring
- are used to locate the shaft axially in both directions
- can accommodate tilting moments because of the distance between the two rows of rollers
- have an outer ring that is 1 mm narrower than the inner ring
- do not require spacer rings between the inner ring and adjacent components, in applications with a rotating outer ring
- have two snap ring grooves in the outer ring:
  - to simplify mounting
  - to save space axially

This is especially valuable where the bearing is mounted in/on an adjacent component, e.g. in rope sheaves ([fig. 23](#)).
- have a PUR contact seal on both sides, fitted in a recess on the inner ring shoulder ([fig. 22](#))
 

The seal lip exerts slight pressure against the outer ring raceway.
- are filled with a high-quality grease with good rust-inhibiting properties ([table 1, page 503](#))
 

For additional information about greases, refer to *Lubrication*, [page 109](#).
- can be supplied open and without grease, for applications where oil lubrication is to be used
 

If a small quantity of bearings without seals is required, the seals can be removed and the bearings can be washed prior to mounting.

## Relubrication

For many application conditions, NNF design sealed bearings do not require relubrication and can be considered relubrication-free. However, if they operate in a moist or contaminated environment, or if speeds are moderate to high, relubrication may be necessary (*Estimating the relubrication interval for grease*, [page 111](#)). The bearings can be relubricated via lubrication holes in both the inner and outer rings.

Fig. 23

NNF design sealed bearing in a rope sheave

# SKF Explorer bearings

Single row and high-capacity bearings are also available as SKF Explorer bearings (page 7).

## Matched bearings

- are combined so that any difference in cross-sectional height of the bearings used in a matched set lies within a very small tolerance range  
This tighter tolerance is a precondition for equal load sharing between the bearings.
- can be supplied as:
  - sets of two bearings (designation suffix DR)
  - sets of three bearings (designation suffix TR)
  - sets of four bearings (designation suffix QR)

## Cages

SKF single row and high-capacity cylindrical roller bearings are fitted with one of the cages shown in table 2.  
When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For additional information about the suitability of cages, refer to *Cages*, page 187.

## Dynamic axial load carrying capacity

Cylindrical roller bearings with flanges on both the inner and outer rings can support, in addition to radial loads, axial loads up to:

- $F_a \leq 0,25 F_r$  for double row full complement bearings
- $F_a \leq 0,5 F_r$  for other design bearings

The axial load carrying capacity is determined by the lubrication condition, operating temperature and heat dissipation at the roller end / flange contact.

The formulae below are valid for normal operating conditions:

- $\Delta T \approx 60^\circ\text{C}$  between the bearing operating and ambient temperature
- specific heat loss  $\approx 0,5 \text{ mW/mm}^2$
- viscosity ratio  $\kappa \geq 2$
- misalignment  $\leq 1$  minute of arc

For misalignment  $> 1$  minute of arc, contact the SKF application engineering service.

### Permissible axial loads

| Conditions            | Mechanical limitations                                                                                                                                                                                                                                                                                                                            | Thermal limitations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Symbols                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# Temperature limits

The permissible operating temperature for cylindrical roller bearings can be limited by:

- the dimensional stability of the bearing rings and rollers
- the cage
- the seals
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

## Bearing rings and rollers

SKF cylindrical roller bearings are heat stabilized up to 150 °C (300 °F).

## Cages

Steel, brass, light alloy or PEEK cages can be used at the same operating temperatures as the bearing rings and rollers. For temperature limits of cages made of other polymer materials, refer to *Polymer cages*, [page 188](#).

## Seals

The permissible operating temperature for PUR seals is -20 to +80 °C (-5 to +175 °F).

Typically, temperature peaks are at the seal lip.

## Lubricants

Temperature limits for greases used in sealed double row full complement cylindrical roller bearings are provided in [table 1](#), [page 503](#). For temperature limits of other SKF greases, refer to *Selecting a suitable SKF grease*, [page 116](#).

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept ([page 117](#)).

# Permissible speed

The speed ratings in the [product tables](#) indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, [page 130](#).

SKF recommends oil lubrication for bearings with a ring centred cage. When these bearings are grease lubricated, the  $nd_m$  value is limited:

- for bearings with an LA, LB, LL, MA, MB, ML, MP, JA, JB or MH cage  
→  $nd_m \leq 250\,000$  mm/min
- for bearings with a PA or PHA cage  
→  $nd_m \leq 450\,000$  mm/min

where

$$d_m = \text{bearing mean diameter [mm]} \\ = 0,5 (d + D)$$

$$n = \text{rotational speed [r/min]}$$

For single row bearings with a standard cage, the values for the limiting speed are listed in the product tables. Conversion factors to estimate the limiting speed for bearings with an alternative standard cage are listed in [table 7](#).

Table 7

### Conversion factors for limiting speeds of single row cylindrical roller bearings

| Bearing with standard cage | alternative standard cage |                 |     |
|----------------------------|---------------------------|-----------------|-----|
|                            | P, PH, J, M, MR           | PA, PHA, MA, MB | ML  |
| P, PH, J, M, MR            | 1                         | 1,3             | 1,5 |
| PA, PHA, MA, MB            | 0,75                      | 1               | 1,2 |
| ML                         | 0,65                      | 0,85            | 1   |

Table 6

### Lubrication factors for cylindrical roller bearings

| Bearing types                         | Lubrication factors |       |                    |       |
|---------------------------------------|---------------------|-------|--------------------|-------|
|                                       | Oil lubrication     |       | Grease lubrication |       |
|                                       | $k_1$               | $k_2$ | $k_1$              | $k_2$ |
| Single row and high-capacity bearings | 1,5                 | 0,15  | 1                  | 0,1   |
| Single row full complement bearings   | 1                   | 0,3   | 0,5                | 0,15  |
| Double row full complement bearings   | 0,35                | 0,1   | 0,2                | 0,06  |

# Design considerations

## Flange support

Where cylindrical roller bearings are subjected to axial loads, total axial run-out (*Tolerances for bearing seats and abutments*, [page 144](#)) and the size of the abutment surfaces of adjacent components are particularly important for an even load distribution on the flange.

The inner ring flange should only be supported up to half of its height ([fig. 24](#)) so that it is not subjected to damaging alternating stresses that can result, for example, from shaft deflection.

For single row bearings and high-capacity bearings the recommended shaft abutment diameter can be obtained using

$$d_{as} = 0,5 (d_1 + F)$$

where

$d_{as}$  = shaft abutment diameter for axially loaded bearings [mm]

$d_1$  = inner ring flange diameter [mm]  
([product tables](#), [page 516](#))

$F$  = inner ring raceway diameter [mm]  
([product tables](#))

For full complement bearings, the recommended shaft abutment diameter  $d_{as}$  is listed in the [product tables](#).

## Mounting

Because of the design and position of the cage of high-capacity cylindrical roller bearings in the NCF .. ECJB and NJF .. ECJA series, the cage cannot prevent the rollers from falling out when the inner and outer rings of the bearing are separated. SKF recommends mounting these high-capacity cylindrical roller bearings as a complete bearing, like full complement cylindrical roller bearings.

Where it is necessary to mount the inner and outer rings separately, use a mounting sleeve ([fig. 25](#)) or a retaining strap ([fig. 26](#)) to keep the rollers in place.

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

Angle ring

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

Angle ring

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

Angle ring

### SKF Explorer bearing

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

► Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.

For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

▶ Popular item

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.  
For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

<sup>1)</sup> When ordering bearings with an alternative standard cage the suffix of the standard cage has to be replaced by the suffix of the alternative cage.  
For example NU .. ECP becomes NU .. ECML (for permissible speed → [page 511](#)).

SKF needle roller bearings are bearings with cylindrical rollers that are small in diameter relative to their length. The modified roller/raceway profile prevents stress peaks to extend bearing service life.

SKF supplies needle roller bearings in many different designs, series and in a wide range of sizes, which make them appropriate for a wide variety of operating conditions and applications.

### Bearing features

- **Low cross section**

In applications where less space is available, needle roller bearings offer a very compact solution ([fig. 1](#)), and drawn cup needle roller bearings enable downsizing.

- **High load carrying capacity**

Owing to their large number of rollers, needle roller bearings have a high load carrying capacity.

- **High stiffness**

Because of their large number of small-diameter rollers, needle roller bearings have high stiffness.

- **Separable design**

The possibility of assembling inner and outer rings separately permits interference fits for shaft and housing and also enables easy maintenance inspections ([fig. 2](#)).

- **Accommodate axial displacement**

Except for bearings with flanges on both the inner and outer rings, needle roller bearings with machined rings can accommodate axial displacement ([fig. 3](#)).

- **Accommodate static misalignment**

Alignment needle roller bearings are self-aligning up to 3° of static misalignment.

- **Locating bearing arrangement**

Combined needle roller bearings accommodate combined radial and axial loads in one or both directions.

#### Separable design

# Designs and variants

## Needle roller and cage assemblies

SKF needle roller and cage assemblies are self-contained, ready-to-mount bearings. In applications where the shaft and housing bore can serve as raceways, the assemblies can be used to create bearing arrangements that require minimal radial space.

### Basic design bearings

- are identified by the series designation K
- are available as (fig. 4):
  - single row design (no designation suffix)
  - double row design (designation suffix ZW)

They are characterized by the following properties:

- simple to mount and robust
- accurate roller guidance in the cage pockets
- good running performance

### Other needle roller and cage assemblies

Needle roller and cage assemblies with a split cage can be used where raceways are recessed in the shaft ([fig. 5](#)).

Special needle roller and cage assemblies are used for the gudgeon (wrist) pin ([fig. 6](#)) and crankpin (crankshaft journal) ([fig. 7](#)) for connecting rods of internal combustion engines and compressors. They provide excellent service in spite of rapid accelerations, elevated temperatures, unfavourable load, and poor lubrication conditions.

For additional information about special sizes and designs, which are available on request, contact SKF.

### Drawn cup needle roller bearings

SKF drawn cup needle roller bearings have a deep drawn, thin-walled outer ring. Drawn cup needle roller bearings are typically used in applications where the housing bore cannot be used as a raceway for a needle roller and cage assembly, but where a very compact and economical bearing arrangement is required. These bearings are mounted with a tight interference fit in the housing. This enables a simple and economic design of the housing bore, as shoulders or snap rings are not required to locate the bearing axially.

The drawn cup of hardened steel and the needle roller and cage assembly of these bearings form a non-separable unit.

### SKF standard assortment

SKF supplies a wide assortment of drawn cup needle roller bearings. This includes:

- bearings with open ends ([fig. 8](#))
- bearings with a closed end ([fig. 9](#))
- full complement bearings with open ends ([fig. 10](#))

SKF drawn cup needle roller bearings:

- are supplied without an inner ring
- are generally designed with one needle roller and cage assembly – except wide sizes, which incorporate two needle roller and cage assemblies immediately adjacent to each other, with a lubrication hole in the outer ring ([fig. 11](#)).

Fig. 5

Needle roller and cage assemblies with a split cage

Fig. 6

Special needle roller and cage assembly for the gudgeon (wrist) pin

Fig. 7

Special needle roller and cage assembly for the crankpin (crankshaft journal)

## Basic design bearings

- **Drawn cup needle roller bearings with open ends** (series designation HK, [fig. 8](#))
  - are available open (without seals) or sealed on one or both sides (Sealing solutions, [page 594](#))
- **Drawn cup needle roller bearings with a closed end** (series designation BK, [fig. 9](#))
  - are available open or sealed (Sealing solutions)
  - are suitable for bearing arrangements where they are situated at the end of a shaft
  - accommodate small axial guidance forces, because of the profiled design of their closed end

- **Full complement bearings with open ends** (series designation HN, [fig. 10](#))
  - are suitable for very heavy radial loads at moderate speeds
  - are available with open ends and without seals only

Full complement drawn cup needle roller bearings are supplied with a special grease to secure the rollers during transport. However, SKF recommends relubricating after mounting. Depending on the required grade, SKF recommends SKF LGEP 2 or SKF LGWM 1 grease for relubrication. The technical specifications of the initial grease fill and the relubrication greases are listed in [table 1](#).

<sup>1)</sup> Refer to the SKF traffic light concept ([page 117](#)).

### Arrangements with components and other bearings

- Generally, drawn cup needle roller bearings run directly on a shaft. However, in applications where the shaft cannot be hardened and ground, bearings should be combined with an inner ring ([fig. 12](#), and *Needle roller bearing inner rings*, [page 593](#)).
- Drawn cup needle roller bearings with wide inner rings ([fig. 12](#) and *Needle roller bearing inner rings*) provide an excellent counterface for the lips of external G or SD design seals ([skf.com/seals](#)).
- Certain sizes of drawn cup needle roller bearings can be combined with a needle roller thrust bearing with a centring flange, AXW series ([fig. 13](#) and *Needle roller thrust bearings*, [page 895](#)), to accommodate combined radial and axial loads.

### Needle roller bearings with machined rings

SKF needle roller bearings with machined rings are made of carbon chromium bearing steel. SKF supplies these bearings with or without flanges on the outer ring, in a wide range of series and sizes. SKF also supplies them with or without an inner ring.

#### Needle roller bearings with machined inner and outer rings

- are used for applications where the shaft cannot be hardened and ground ([fig. 14](#))
- have limited permissible axial displacement of the shaft relative to the housing ([fig. 3](#), [page 583](#) and [product table](#), [page 636](#)), which can be extended, if needed, by using a wide inner ring (*Needle roller bearing inner rings*, [page 593](#))

#### Needle roller bearings with a machined outer ring, without an inner ring

- are an excellent choice for compact bearing arrangements if the shaft can be hardened and ground ([fig. 15](#))
- enable a larger shaft diameter and a stiffer bearing arrangement compared to arrangements with bearings with inner rings

Axial displacement of the shaft relative to the housing is only limited by the width of the raceway on the shaft. By machining the shaft raceways to the appropriate dimensional and geometrical tolerances, it is possible to obtain bearing arrangements with tighter geometrical tolerances. For additional information, refer to *Raceways on shafts and in housings*, [page 179](#).

Fig. 15

Needle roller bearing with a machined outer ring

Fig. 16

Needle roller bearing with non-separable closure rings

NK ( $F_w \leq 10 \text{ mm}$ )

## Basic design bearings

### Needle roller bearings with machined rings, with flanges

- are available open (without seals) or sealed on one or both sides
  - are available with or without an inner ring
  - with  $D \leq 17 \text{ mm}$  ( $F_w \leq 10 \text{ mm}$ ), are available with non-separable closure rings that act as flanges (fig. 16)
- The flanges on larger bearings are an integral part of the outer ring, and the bearings have an annular groove and one or more lubrication holes in the outer ring (fig. 17).
- are generally designed as single row bearings, with the exception of RNA 69 (fig. 18) and NA 69 series double row bearings with  $D \geq 52 \text{ mm}$  ( $F_w \geq 40 \text{ mm}$ )

The roller and cage assembly and outer ring of a needle roller bearing with flanges form a non-separable unit.

### Needle roller bearings with machined rings, without flanges

- are separable, i.e. the outer ring, needle roller and cage assembly, and inner ring, can all be mounted separately (fig. 19)
- Needle roller and cage assemblies can, depending on the arrangement design, either be mounted:
- together with the outer ring
  - together with the shaft
  - together with the inner ring
  - between the outer ring and shaft or inner ring as the final step
- However, needle roller and cage assemblies and bearing outer rings must always be kept together as supplied.
- are generally designed with one needle roller and cage assembly
- However, wide sizes incorporate two needle roller and cage assemblies immediately adjacent to each other and have an annular groove and a lubrication hole in the outer ring (fig. 20).

### Arrangements with other bearings

To accommodate combined radial and axial loads, needle roller bearings with machined rings can be combined with a needle roller thrust bearing with a centring flange, AXW series, if the outside diameter  $D$  of the radial bearing is equal to the flange diameter  $D_1$  of the thrust bearing (fig. 21, and *Needle roller thrust bearings*, page 895).

With an inner ring

## Alignment needle roller bearings

SKF alignment needle roller bearings have an outer ring with a sphered (convex) outside surface. Two polymer seating rings with a sphered (concave) inside surface are encased in a drawn sheet steel sleeve and fitted over the outer ring.

SKF supplies alignment needle roller bearings with or without an inner ring ([fig. 22](#)).

### Bearings with an inner ring

- should be used in applications where the shaft cannot be hardened and ground
- have limited permissible axial displacement of the shaft relative to the housing ([product table, page 650](#)), which can be extended, if needed, by using a wide inner ring ([Needle roller bearing inner rings, page 593](#))

### Bearings without an inner ring

- are an excellent choice for compact bearing arrangements, if the shaft can be hardened and ground.

## Combined needle roller bearings

SKF combined needle roller bearings consist of a radial needle roller bearing combined with a thrust bearing. They can accommodate both radial and axial loads. They are particularly suitable for applications where other types of locating bearing arrangements occupy too much space, or where the axial loads are too heavy, the speeds are too high, or the lubricant is inadequate for arrangements with simple thrust washers. SKF supplies combined needle roller bearings in the following basic designs:

- needle roller / angular contact ball bearing
- needle roller / thrust ball bearing
- needle roller / cylindrical roller thrust bearing

Relubrication intervals for the radial and thrust part of the bearing must be calculated separately. The shorter of the two intervals should be used. For additional information about lubrication, refer to [Lubrication, page 110](#).

## Needle roller / angular contact ball bearings

SKF supplies needle roller / angular contact ball bearings without seals in two series ([fig. 23](#)):

- NKIA 59 series bearings can accommodate axial loads in one direction
- NKIB 59 series bearings can accommodate axial loads in both directions

These combined bearings:

- consist of a radial needle roller bearing and an angular contact ball bearing
- accommodate heavy radial loads, carried exclusively by the needle roller bearing
- accommodate light axial loads, carried exclusively by the angular contact ball bearing
- are low cross section bearings
- can operate at high speeds
- are separable, i.e. the inner ring can be mounted separately from the outer ring and rolling element and cage assemblies
- can be grease or oil lubricated, depending on the application

In the case of grease lubrication, both the needle roller and angular contact ball bearings should be filled with the same lubricant prior to mounting.

Fig. 22

### Alignment needle roller bearing

With an inner ring, PNA

Without an inner ring, RPNA

## NKIA series bearings

- can accommodate axial loads in one direction and, therefore, locate the shaft in one direction only
- can be mounted back-to-back (fig. 24), for short shafts and where changes in length due to thermal expansion are relatively minor

## NKIB series bearings

- can locate the shaft in both directions
- have axial clearance, between 0,08 and 0,25 mm
- have a two-piece inner ring to facilitate mounting
 

When mounting the inner ring, it is important that the two pieces are axially clamped to one another.
- have inner rings, which are not interchangeable with those from another seemingly identical bearing (keep together as supplied)

Fig. 23

### Needle roller / angular contact ball bearing

NKIA 59

NKIB 59

Fig. 24

### NKIA series bearings arranged back-to-back

### Needle roller / thrust ball bearings

SKF supplies needle roller / thrust ball bearings in two series (fig. 25):

- NX series with a full complement thrust ball bearing
- NKX series with a thrust ball bearing with a cage

These combined bearings:

- consist of a radial needle roller bearing and a thrust ball bearing
- are supplied without an inner ring
- can be combined with an inner ring (fig. 26), where the shaft cannot be hardened and ground (product tables, page 654 and page 656, must be ordered separately)
- can accommodate axial loads in one direction and, therefore, locate the shaft in one direction only

- can be mounted back-to-back (fig. 27), for short shafts and where changes in length due to thermal expansion are relatively minor

For these types of arrangements, SKF recommends preloading the thrust ball bearings with Belleville washers (cup springs). This preload helps to prevent the balls from skidding if one of the thrust bearings becomes unloaded. Preload also improves performance of the thrust ball bearings while reducing noise levels.

### NX series bearings

- consist of a radial needle roller bearing and a full complement thrust ball bearing (fig. 28)
- are suitable for applications where there are moderate radial loads and lighter, single direction axial loads
- have low cross-sectional height, which enables shaft centrelines to be positioned close together like for multi-spindle drills
- can be mounted with a snap ring, or against a shoulder in the housing bore, for axial support

The snap ring groove in the outer ring provides a cost-effective and axially space-saving solution (fig. 29 and product tables, 7.8, page 654).

- are most often oil lubricated and therefore supplied without grease
- have a stamped steel cover that
  - extends over the shaft washer of the full complement thrust ball bearing
  - is firmly attached to the radial needle roller bearing
  - makes these bearings non-separable
  - has lubrication holes as standard
  - has no lubrication holes for bearings with designation suffix Z (fig. 28)

These bearings can be grease lubricated.

Fig. 25

#### Needle roller / thrust ball bearing

Full complement thrust bearing, NX

Thrust bearing with a cage, NKX

Fig. 26

#### NX series bearing with an inner ring

Fig. 27

#### NKX series bearings arranged back-to-back, incorporating Belleville washers

## NKX series bearings with a cage

- consist of a radial needle roller bearing and a thrust ball bearing with a ball and cage thrust assembly identical to the 511 series ([fig. 30](#))
- permit relatively high-speed operation
- are located axially in one direction by the outer ring flange
- can be mounted separately from both the ball and cage assembly and shaft washer
- should be oil lubricated, as there is no cover that retains the grease in the bearing
- have no stamped steel cover, as standard
- have a stamped steel cover for bearings with designation Z ([fig. 30](#)) that
  - has no lubrication holes
  - extends over the shaft washer of the thrust ball bearing
  - is firmly attached to the housing washer that is integral to the needle roller bearing outer ring
  - makes these bearings non-separable

Fig. 30

### Needle roller / thrust ball bearing with a cage

NKX

NKX..Z

### Needle roller / cylindrical roller thrust bearings

SKF supplies needle roller / cylindrical roller thrust bearings in the NKXR series (fig. 31).

These combined bearings:

- consist of a radial needle roller bearing and a cylindrical roller thrust bearing
- The cylindrical roller and cage thrust assembly is identical to the 811 series.
- are supplied without an inner ring
- can be combined with an inner ring (fig. 32), where the shaft cannot be hardened and ground (product table, page 658, must be ordered separately)
- can accommodate axial loads in one direction
- can locate the shaft in one direction only
- can be mounted back-to-back (fig. 33) for short shafts and where changes in length due to thermal expansion are relatively minor

For these types of arrangements, SKF recommends preloading the thrust ball bearings with Belleville washers (cup springs). This elastic preload helps to prevent the balls from skidding if one of the thrust bearings becomes unloaded. Preload also improves performance of the thrust ball bearings while reducing noise levels.

### NKXR series bearings

- are separable
- can be mounted separately from both the cylindrical roller and cage thrust assembly and the shaft washer
- should be oil lubricated, as oil facilitates an adequate supply of lubricant to the bearing
- have no stamped steel cover, as standard
- have a stamped steel cover for bearings with designation suffix Z (fig. 34) that
  - has no lubrication holes
  - extends over the shaft washer of the cylindrical roller thrust bearing
  - is firmly attached to the housing washer that is integral to the needle roller bearing outer ring
  - makes these bearings non-separable

Fig. 35

Inner rings

IR

LR

# Needle roller bearing components

## Needle roller bearing inner rings

SKF supplies inner rings for needle roller bearings separately. They are typically combined with needle roller and cage assemblies (page 583) or drawn cup needle roller bearings (page 584) in applications where the shaft cannot be hardened and ground.

Inner rings are available in two series (fig. 35):

- IR series
  - with or without a lubrication hole
  - with or without a machining allowance
- LR series

Both inner ring series:

- are also available in different widths
- permit greater axial displacement of the shaft, relative to the housing, when they are wider than standard
  - provide an excellent counterface for the lips of contact seals (fig. 12, page 586)
- should be located on both sides to prevent axial movement (regardless of whether the ring has an interference or loose fit)
  - one side can be located against a shoulder
  - the other side can be located by either a snap ring, a distance ring or a nut

## IR series inner rings

- are the standard SKF inner rings for needle roller bearings
- are hardened and ground
- have a precision ground raceway surface with a lead-in chamfer on both sides

The chamfers facilitate assembly and protect the seal lips from damage during the mounting process.

- are available in some sizes with a lubrication hole (designation suffix IS1, fig. 36)

Inner rings with additional lubrication holes are available on request.

- are available on request with a pre-ground raceway and a machining allowance (designation suffix VGS, table 2)

They can be finish ground after mounting on a shaft in applications where extremely tight geometrical tolerances are required.

## LR series inner rings

- are hardened, and the bore and raceway diameter are ground
- side faces are turned and the edges are smoothed
- can be used to provide a cost-effective bearing arrangement for applications where the larger run-out and width tolerances are less important

## Needle rollers

Needle rollers can be used to design full complement bearing arrangements for low-speed or oscillating applications. These compact bearing arrangements have a very high load carrying capacity when compared to bearings with a cage and are economical, provided the shaft and housing bore can serve as raceways (*Raceways on shafts and in housings*, page 179).

Needle rollers:

- are not listed in this catalogue, but can be found online at [skf.com/go/17000-7-12](http://skf.com/go/17000-7-12)
- are made of carbon chromium steel
- have a hardness of 58 to 65 HRC
- have a precision ground surface

For assistance in designing full complement bearing arrangements or to calculate performance data for these bearing arrangements, contact the SKF application engineering service.

## Sealing solutions

### Associated external seals

- can be used for needle roller bearing arrangements (fig. 12, page 586)
- can be supplied in various sizes, as listed in the product tables:
  - Needle roller and cage assemblies, page 614
  - Drawn cup needle roller bearings, page 618
  - Needle roller bearings with machined rings with flanges, without an inner ring, page 624

For information about associated power transmission seals, refer to [skf.com/seals](http://skf.com/seals).

### Capped bearings

SKF supplies certain needle roller bearings capped with a seal or steel cover. The assortment of capped bearings includes:

- drawn cup needle roller bearings, sealed on one or both sides
- needle roller bearings with machined rings in the (R)NA 49 series, sealed on one or both sides
- combined needle roller bearings, capped with a steel cover over the thrust part of the bearing

When capped bearings must operate under certain conditions, such as very high speeds or high temperatures, some grease may leak. For bearing arrangements where this would be detrimental, appropriate actions could be taken.

### Sealed drawn cup needle roller bearings

For applications where a sufficiently effective seal is not available, or cannot be used for space reasons, SKF supplies certain drawn cup needle roller bearings as sealed bearings. The assortment includes:

- drawn cup needle roller bearings with open ends (fig. 37)
  - available for  $8 \leq F_w \leq 50$  mm
  - sealed on one side (designation suffix RS)
  - sealed on both sides (designation suffix .2RS)
- sealed drawn cup needle roller bearings with a closed end (designation suffix RS, fig. 38)
  - available for  $10 \leq F_w \leq 25$  mm

These integral contact seals are made of PUR, FKM or NBR. Sealed drawn cup needle roller bearings are, under normal conditions and with appropriate counterface, an extremely cost-effective solution to exclude solid contaminants and moisture, and retain the lubricant in the bearing.

#### ⚠ WARNING

Seals made of FKM (fluoro rubber) exposed to an open flame or temperatures above 300 °C (570 °F) are a health and environmental hazard! They remain dangerous even after they have cooled.

Read and follow the safety precautions on page 197.

## Sealed needle roller bearings with machined rings

- are available in the (R)NA 49 series with a contact seal made of NBR (effective at keeping the lubricant in and contaminants out of the bearing) on one (designation suffix RS) or both sides (designation suffix .2RS) (fig. 39)
- have an inner ring that is 1 mm wider than the outer ring, which maintains the effectiveness of the seals and simplifies the bearing arrangements even when small axial displacements occur

## Capped combined needle roller bearings

SKF supplies certain combined needle roller bearings capped with a stamped steel cover over the thrust part of the bearing (designation suffix Z). The cover, which has no lubrication holes, forms a gap-type seal to retain

the grease in the bearing. The assortment includes:

- needle roller / full complement thrust ball bearings (fig. 28, page 591)
- needle roller / thrust ball bearings (fig. 30, page 591)
- needle roller / cylindrical roller thrust bearings (fig. 34, page 592)

## Greases for capped bearings

Needle roller bearings with one or two seals are supplied greased. The thrust part of combined needle roller bearings with the designation suffix Z is also supplied greased. They are filled with high-quality grease (table 3) under clean conditions.

The relatively large quantity of grease in the bearings means they can be operated for long periods before relubrication is required. SKF recommends SKF LGWA 2 grease (table 3), if relubrication is required.

## Relubrication features

SKF supplies needle roller bearings with different features to facilitate effective lubrication and relubrication.

### Drawn cup needle roller bearings

All double row drawn cup needle roller bearings have one lubrication hole in the outer ring (fig. 11, page 585), as standard.

On request, SKF can supply any single row drawn cup needle roller bearing for inside diameters under the rollers  $F_w \geq 7$  mm with a lubrication hole in the outer ring (fig. 40).

Table 3

### Technical specifications of greases for capped needle roller bearings

| Grease              | Temperature range <sup>1)</sup> |   |    |     |     |     |        | Thickener            | Base oil type | NLGI grade | Base oil viscosity [mm <sup>2</sup> /s] |                    |
|---------------------|---------------------------------|---|----|-----|-----|-----|--------|----------------------|---------------|------------|-----------------------------------------|--------------------|

7 Needle roller bearings

Needle roller bearings with machined rings

- with flanges and  $D \geq 19$  mm ( $F, F_w \geq 12$  mm) have an annular groove and, depending on the bearing size, one or more lubrication holes in the outer ring (fig. 17, page 587)
- with seal(s) have an additional lubrication hole in the inner ring (fig. 39, page 595)
- double row and without flanges have an annular groove with one lubrication hole in the outer ring (fig. 20, page 587)
- without flanges and with an inner ring have one lubrication hole in the inner ring for certain sizes (product table, page 636)

Combined needle roller bearings

The needle roller bearing used in combined bearings has an annular groove with one lubrication hole in the outer ring.

Needle roller / full complement thrust ball bearings in the NX series without the designation suffix Z have a cover with lubrication holes over the thrust part of the bearing (fig. 28, page 591). Most often they are oil lubricated and, therefore, SKF supplies these bearings without grease.

Cages

SKF needle roller bearings are fitted with one of the cage designs shown in table 4.

When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For additional information about the suitability of cages, refer to Cages, page 187.

Double row needle roller bearings

Double row needle roller and cage assemblies have a double row cage in the same design as a single row cage (fig. 4, page 583).

Other double row needle roller bearings are fitted with two cage assemblies (fig. 11, page 585, and fig. 18, page 587).

Cages for needle roller bearings

The mean value of the needle roller gauge should be used to calculate the internal clearance, e.g. -6 µm for the gauge -5 to -7 µm.

Table 8

## Tolerances for drawn cup needle roller bearings

| Bearing<br>Inside<br>diameter<br>$F_w$ | Outside<br>diameter<br>D | Ring gauge<br>Bore<br>diameter<br>(measured) | Deviations from nominal<br>inside diameter |     | Bearing<br>Inside<br>diameter<br>$F_w$ | Outside<br>diameter<br>D | Ring gauge<br>Bore<br>diameter<br>(measured) | Deviations from nominal<br>inside diameter |     |

## Dimensional and geometrical tolerances of SKF needle rollers, grade G2

| Diameter $D_w$ |     | Gauge tolerance | Gauge limits                                                                  | Roundness<br>(max. circularity deviation in accordance with ISO 3096) | Length $L_w$<br>Tolerance class |
|----------------|-----|-----------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------|---------------------------------|
| Deviation      |     |                 |                                                                               |                                                                       |                                 |
| U              | L   |                 |                                                                               |                                                                       |                                 |
| μm             |     |                 |                                                                               |                                                                       | –                               |
| 0              | –10 | 2               | 0/–2<br>–1/–3<br>–2/–4<br>–3/–5<br>–4/–6<br>–5/–7<br>–6/–8<br>–7/–9<br>–8/–10 | 1                                                                     | h13 <sup>Ⓔ</sup>                |

Preferred diameter deviations range from 0 to –7 μm.  
Each gauge is packed separately and marked with the gauge limits, e.g. N/M2 or M2/M4, where M signifies minus and N zero. For a needle roller with a 2 mm nominal diameter and gauge limits M2/M4, the actual diameter is between 1,998 mm and 1,996 mm.

# Temperature limits

The permissible operating temperature for needle roller bearings can be limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cages
- the seals
- the seating rings
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

## Bearing rings and rolling elements

SKF needle roller bearings, and roller and cage assemblies are heat stabilized up to 120 °C (250 °F).

Drawn cup needle roller bearings are heat stabilized up to 140 °C (285 °F).

## Cages

Steel cages can be used at the same operating temperatures as the bearing rings and rolling elements. For temperature limits of polymer cages, refer to *Polymer cages*, [page 188](#).

## Seals

The permissible operating temperature for seals depends on the seal material:

- NBR: -40 to +100 °C (-40 to +210 °F)  
Temperatures up to 120 °C (250 °F) can be tolerated for brief periods.
- PUR: -30 to +100 °C (-20 to +210 °F)
- FKM: -30 to +200 °C (-20 to +390 °F)  
Temperatures up to 230 °C (445 °F) can be tolerated for brief periods.

Typically, temperature peaks are at the seal lip.

## Seating rings

The permissible operating temperature for seating rings is -30 to +100 °C (-20 to +210 °F).

## Lubricants

Temperature limits for greases used in capped needle roller bearings are provided in [table 3, page 595](#), and for full complement drawn cup needle roller bearings in [table 1, page 585](#). For temperature limits of other SKF greases, refer to *Selecting a suitable SKF grease*, [page 116](#).

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept ([page 117](#)).

# Permissible speed

The speed ratings in the **product tables** indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, [page 129](#).

# Design considerations

For general information, refer to *Bearing interfaces*, [page 140](#).

## Abutment dimensions

### Needle roller and cage assemblies

Appropriate abutment diameters are provided in [table 15](#).

Recommendations for surfaces of adjacent machine components that guide needle roller and cage assemblies axially:

- fine turned and polished
- hardened and ground for high-speed operations
- no interruptions

For less demanding applications, snap rings can be used. Otherwise, use an intermediate ring, e.g. a spring steel washer, between the snap ring and the cage assembly.

### Needle roller bearings with machined rings, without flanges

Appropriate abutment diameters are listed in the [product tables](#).

Recommendations for surfaces of adjacent machine components that guide the cage of needle roller bearings without flanges axially:

- fine turned and polished
- hardened and ground for high-speed operations
- no interruptions

For less demanding applications, snap rings can be used. Otherwise, use an intermediate ring, e.g. a spring steel washer, between the snap ring and the cage assembly.

### Combined needle roller bearings

The diameter of the thrust bearing support surface in the housing should be at least 0,5 mm larger than the dimension  $D_1$  or  $D_2$  ([fig. 41](#) and product tables of *Needle roller / thrust ball bearings*, [page 656](#), and *Needle roller / cylindrical roller thrust bearings*, [page 658](#)).

Fig. 41

Abutment dimensions, combined needle roller bearing

# Shaft and housing tolerances

The following tables provide tolerance classes to obtain suitable fits and an appropriate operating clearance (page 598) for the following bearings:

- drawn cup needle roller bearings
- needle roller bearings with machined rings
- alignment needle roller bearings
- combined needle roller bearings

Shaft and housing raceway tolerances significantly influence the operating clearance of needle roller and cage assemblies and needle roller bearings with a machined outer ring (without an inner ring) and, therefore, are provided under *Operating clearance*, page 598.

For additional information about raceways, refer to *Raceways on shafts and in housings*, page 179.

## Drawn cup needle roller bearings

Suitable tolerance classes for the housing bore and shaft for bearings with or without an inner ring are provided in table 16.

## Needle roller bearings with machined rings

- Suitable tolerance classes for the shaft for bearings with machined inner and outer rings are provided in table 18.
- Housing seat tolerances for standard conditions are provided in table 8, page 151.

## Alignment needle roller bearings

Suitable tolerance classes for the housing bore and shaft for bearings with or without an inner ring are provided in table 16.

## Combined needle roller bearings

Suitable tolerance classes for the housing bore and shaft for bearings with or without an inner ring are provided in table 17.

Table 16

### Shaft and housing tolerance classes for drawn cup and alignment needle roller bearings

| Housing material <sup>1)</sup> | Tolerance classes <sup>2)</sup><br>Housing bore seat <sup>3)</sup> | Raceway on the shaft | Shaft inner ring seat |
|--------------------------------|--------------------------------------------------------------------|----------------------|-----------------------|
| Steel, cast iron               | N6                                                                 | h5                   | k5                    |
| Light alloy                    | R6                                                                 | h5                   | k5                    |

<sup>1)</sup> For housings that are not rigid, determine the shaft tolerance by trial and error.

<sup>2)</sup> The envelope requirement (symbol  $\oplus$  from ISO 14405-1) is not shown but applies to all tolerance classes.

<sup>3)</sup> The geometrical tolerance in accordance with ISO 1101 for the housing bore of drawn cup needle roller bearings must correspond to IT5/2 tolerance grade.

Table 17

### Shaft and housing tolerance classes for combined needle roller bearings

| Thrust part                       | Tolerance class <sup>1)</sup><br>Housing bore seat | Shaft (raceway and inner ring seat) |
|-----------------------------------|----------------------------------------------------|-------------------------------------|
| Angular contact ball bearing      | M6                                                 | k5                                  |
| Thrust ball bearing               | K6 <sup>2)</sup>                                   | k5                                  |
| Cylindrical roller thrust bearing | K6 <sup>2)</sup>                                   | k5                                  |

<sup>1)</sup> The envelope requirement (symbol  $\oplus$  from ISO 14405-1) is not shown but applies to all tolerance classes.

<sup>2)</sup> For stiff bearing arrangements, SKF recommends an M6  $\oplus$  housing bore tolerance class.

# Mounting

Drawn cup and alignment needle roller bearings should be pressed into the housing bore using a mounting dolly (fig. 42). An O-ring provides a simple means of retaining the bearing on the mounting dolly. The stamped side (side face with the designation) should abut the flange of the mounting dolly.

Special care should be taken to prevent the bearing from skewing or tilting when it is being pressed into the housing. Otherwise the rollers and raceways could easily be damaged.

For grease lubricated bearings, the bearing should be lubricated prior to mounting.

## Paired mounting

If bearings are to be mounted immediately adjacent to each other, the load should be shared equally by both bearings. Therefore, the following need to be considered:

- Full complement needle roller arrangements should incorporate rollers of the same gauge.
- Needle roller and cage assemblies should incorporate rollers of the same gauge
- Drawn cup needle roller bearings should have the same deviations from the nominal inside diameter  $F_w$ .

A delivery of needle rollers of the same nominal diameter may contain packages of one or more gauges. The gauge limits are also printed on the package.

For needle roller and cage assemblies, the deviation from the nominal dimensions of the fitted needle rollers is printed on the package.

For additional information about gauges and inside diameter, refer to *Tolerances*, page 598.

Fig. 42

Mounting dolly

Table 18

Shaft tolerance classes for needle roller bearings with machined inner and outer rings on solid steel shafts

| Conditions                                                         | Shaft diameter | Dimensional tolerance <sup>1)</sup> | Total radial run-out tolerance <sup>2)</sup> | Ra  |
|--------------------------------------------------------------------|----------------|-------------------------------------|----------------------------------------------|-----|

| Group 4 |     |     |     |     |     |
|---------|-----|-----|-----|-----|-----|
| 4.1     | 4.2 | 4.3 | 4.4 | 4.5 | 4.6 |

**Group 4.6: Other variants**

**VG052** Single split PES (polyethersulfone) cage

**Group 4.5: Lubrication**

**SM..** Special grease, two numbers following identify the grease

**Group 4.4: Stabilization**

**S0** Bearing or inner ring heat stabilized for operating temperatures  $\leq 150^\circ\text{C}$  ( $300^\circ\text{F}$ )

**S1** Bearing or inner ring heat stabilized for operating temperatures  $\leq 200^\circ\text{C}$  ( $390^\circ\text{F}$ )

**S2** Bearing or inner ring heat stabilized for operating temperatures  $\leq 250^\circ\text{C}$  ( $480^\circ\text{F}$ )

**S3** Bearing or inner ring heat stabilized for operating temperatures  $\leq 300^\circ\text{C}$  ( $570^\circ\text{F}$ )

**Group 4.3: Bearing sets, matched bearings**

**..S** Matched bearings for an equal load distribution. The number preceding indicates the number of bearings, e.g. NK 50/25 TN/2S

**Group 4.2: Accuracy, clearance, preload, quiet running**

**/SORT..** Tolerance grade of needle rollers of a needle roller and cage assembly, the numbers following identify the actual limits in  $\mu\text{m}$ , e.g. /SORT-2-4

**CN** Normal radial internal clearance; only used together with an additional letter that identifies a reduced or displaced clearance range

**H** Reduced clearance range corresponding to the upper half of the actual clearance range

**L** Reduced clearance range corresponding to the lower half of the actual clearance range

**M** Reduced clearance range corresponding to the two middle quarters of the actual clearance range

**P** Displaced clearance range comprising the upper half of the actual clearance range plus the lower half of the next larger clearance range

**R** Normal clearance range in accordance with the withdrawn DIN 620-4

The above letters H, L, M and P are also used together with the clearance classes C2, C3, C4.

**C2** Radial internal clearance smaller than Normal

**C3** Radial internal clearance greater than Normal

**C4** Radial internal clearance greater than C3

**G2** Needle roller in accordance with ISO 3096 Grade 2

**H..** Bearing without an inner ring and reduced inside diameter (under rollers) tolerance, the numbers following indicate the tolerance limits in  $\mu\text{m}$ , e.g. H+27+20

**M../M..** Diameter tolerance of needle rollers, e.g. M2/M4 indicates diameter tolerance  $-2$  to  $-4 \mu\text{m}$

**N/M..** Diameter tolerance of needle rollers, e.g. N/M2 indicates diameter tolerance  $0$  to  $-2 \mu\text{m}$

**P5** Dimensional and geometrical tolerances to class P5

**P6** Dimensional and geometrical tolerances to class P6

**P62** P6 + C2

**P63** P6 + C3

**P6CNR** P6 + CNR

**Group 4.1: Materials, heat treatment**

## 7.1 Needle roller and cage assemblies

SKF bearing maintenance handbook ISBN 978-91-978966-4-1

Tapered roller bearings have tapered inner and outer ring raceways as well as tapered rollers. They are designed to accommodate combined loads, i.e. simultaneously acting radial and axial loads. The projection lines of the raceways meet at a common point on the bearing axis (apex point A, [fig. 1](#)) to provide a true rolling action and therefore low frictional moments during operation. The axial load carrying capacity of tapered roller bearings increases with increasing contact angle  $\alpha$ . The size of the contact angle, which is usually between  $10^\circ$  and  $30^\circ$ , is related to the calculation factor  $e$  ([product tables, page 694](#)); the larger the value of  $e$ , the larger the contact angle.

## Bearing features

- **Low friction**

The optimized roller end design and surface finish on the flange (fig. 2) promote lubricant film formation, resulting in lower friction. This also reduces frictional heat and flange wear. In addition, the bearings can better maintain preload and run at reduced noise levels.

- **Long service life**

The crowned raceway profiles of basic design bearings and the logarithmic raceway profiles of SKF Explorer bearings optimize the load distribution along the contact surfaces, reduce stress peaks at the roller ends (fig. 3), and reduce the sensitivity to misalignment and shaft deflection compared with conventional straight raceway profiles (fig. 4).

- **Enhanced operational reliability**

Optimized surface finish on the contact surfaces of the rollers and raceways supports the formation of a hydrodynamic lubricant film.

## 8 Tapered roller bearings

- **Consistency of roller profiles and sizes**

The rollers incorporated in SKF tapered roller bearings are manufactured to such close dimensional and geometrical tolerances that they are practically identical. This provides optimal load distribution, reduces noise and vibration, and enables preload to be set more accurately.

- **Rigid bearing application**

A single row tapered roller bearing is typically adjusted against a second tapered roller bearing. By applying a preload, a rigid bearing application can be achieved.

- **Running-in period with reduced temperature peaks**

Tapered roller bearings typically have a running-in period, during which a conventional design tapered roller bearing experiences a significant amount of friction, resulting in wear. This effect is noticed as a temperature spike (diagram 1). With SKF tapered roller bearing designs, friction, frictional heat and wear are significantly reduced, provided the bearings are mounted and lubricated correctly.

- **Separable and interchangeable**

Depending on the design, tapered roller bearings are separable and components of same-sized bearings are fully interchangeable. For example, single row tapered roller bearings are separable (fig. 5), i.e. the inner ring with roller and cage assembly (cone) can be mounted separately from the outer ring (cup). This facilitates mounting, dismounting and also maintenance inspection routines.

SKF manufactures tapered roller bearings in many designs, series and sizes. In addition to the bearings presented in this catalogue, SKF supplies tapered roller bearings for special application requirements. This assortment includes:

- *Four-row tapered roller bearings*  
→ [skf.com/bearings](https://skf.com/bearings)
- hub units for industrial, automotive, railway and off-highway applications  
→ contact SKF

On request, SKF can also supply customized tapered roller bearings for various operating conditions to meet the customer and application requirements.

# Designs and variants

## Single row tapered roller bearings

SKF single row tapered roller bearings (fig. 6) are available in many designs and variants and in many series and sizes, including:

- basic design bearings
- application-specific bearings
- bearings with a flanged outer ring
- SKF Explorer bearings (page 675)

### Basic design bearings

- have a design and internal geometry that provide long service life
- have crowned raceway profiles and an optimized surface finish of the inner ring guide flange that enables them to run cooler and consume less lubricant than conventional design bearings
- have load rating values that are in accordance with ISO and even above (product tables, page 762)
- offer a cost-effective solution for standard industrial applications

On request, SKF can also supply any inner ring with roller and cage assembly (cone) or any outer ring (cup) separately (fig. 7).

### Application-specific bearings

For applications where the bearings are subjected to unique operating conditions, SKF manufactures customized single row tapered roller bearings on request. To meet the needs of these particular applications, SKF manufactures, for example, pinion or low-friction bearings with the following features:

### Pinion bearings

- are designed for pinion shafts in the differentials of automotive transmissions to provide a constant, accurate gear mesh
- have very narrow geometrical tolerances and high preload capability
- have special friction characteristics and can be axially adjusted within narrow limits using the friction-torque method
- have an internal design that supports the formation of a hydrodynamic lubricant film to substantially reduce friction, and consequently the operating temperature, during the running-in period
- retain their preload setting when mounted, lubricated and maintained properly
- are identified by the designation suffix CL7C

### Low-friction bearings

- are designed to meet the ever-increasing demands to reduce friction and energy use
- optimize a reduction in friction through their internal geometry, number of rollers, surface finish and redesign of their cage
- have a frictional moment that is at least 30% lower when compared with a same-sized SKF standard bearing
- normally do not need a running-in procedure because their optimized contact profiles provide optimum load distribution and they experience only a small, controlled loss of initial preload
- generate less frictional heat and therefore enable extended lubrication intervals or operation at higher speeds
- have a roller and cage assembly with a lower mass and therefore reduced inertial forces in the bearing, which reduce the risk of skidding and smearing
- are typically used in automotive and industrial transmissions

Separately packed components

## 8 Tapered roller bearings

### Bearings with a flanged outer ring

SKF also manufactures certain sizes of single row tapered roller bearings with a flange on the outer ring ([fig. 8](#)). These bearings are easy to locate axially in the housing. The housing bore can be manufactured more easily and more cost-effectively because housing shoulders are not required.

### Matched tapered roller bearings

The SKF assortment of matched single row tapered roller bearings ([fig. 9](#)) is based on popular sizes of single row tapered roller bearings. Depending on the application requirements, matched tapered roller bearings are available in different designs and variants:

- matched bearings arranged face-to-face
- matched bearings arranged back-to-back
- matched bearings arranged in tandem
- basic design and SKF Explorer bearings ([page 675](#))

The matched bearings listed in the product tables constitute the basic SKF assortment. SKF can supply other matched bearings on request.

Depending on the design, matched bearings can locate the shaft axially in both directions with a specific axial clearance or preload. Also depending on the design, these bearings can provide a relatively stiff bearing arrangement.

The bearings and ring spacer(s) are matched in production, are delivered as a set and are ready-to-mount.

### Matched bearings arranged face-to-face

- have load lines that converge toward the bearing axis ([fig. 10](#))
- can accommodate a limited amount of misalignment
- can accommodate axial loads in both directions
- are supplied with an intermediate outer ring spacer as a set

### Matched bearings arranged back-to-back

- have load lines that diverge toward the bearing axis ([fig. 11](#))
- provide a relatively stiff bearing arrangement
- can accommodate tilting moments
- can accommodate axial loads in both directions
- are supplied with intermediate inner and outer ring spacers as a set

Fig. 8

Bearing with a flanged outer ring

Fig. 9

Matched single row tapered roller bearings

Fig. 10

Matched bearings arranged face-to-face

Fig. 11

Matched bearings arranged back-to-back

## Matched bearings arranged in tandem

- have load lines that are parallel ([fig. 12](#))
- share radial and axial loads equally
- are used when the load carrying capacity of a single bearing is inadequate
- can accommodate axial loads in one direction only
  - If axial loads act in both directions, a third bearing must be added and adjusted against the tandem pair.
- are supplied with intermediate inner and outer ring spacers as a set

## Double row tapered roller bearings

SKF manufactures double row tapered roller bearings in the TDO ([fig. 13](#)) and TDI ([fig. 14](#)) designs, in many variants and with different features.

Depending on the design, these bearings can accommodate heavy radial loads, axial loads in both directions and have a high degree of stiffness. Therefore, they provide a stiff bearing arrangement and locate the shaft in both directions with a specific axial clearance or preload. Because of their second row of rollers, double row tapered roller bearings are suitable for heavy radial and axial loads.

Double row tapered roller bearings are typically used in gearboxes, hoisting equipment, rolling mills and machines in the mining industry, e.g. tunnelling machines.

## TDO design bearings

- have one double row outer ring (double cup) and two inner rings with roller and cage assemblies (cones), usually with an intermediate ring between the two inner rings ([fig. 13](#))
- have rows of rollers arranged back-to-back (load lines diverge toward the bearing axis), which enable stiff arrangements and accommodate considerable tilting moments
- are ready-to-mount units, manufactured with the predetermined axial clearance or preload
- can be used either as locating or non-locating bearings:
  - for non-locating arrangements, the axial displacement should take place between the outer ring and the housing bore
  - bearings with a blind hole or locating slot in the outer ring can be used with a cylindrical pin engaged in the hole or slot to prevent the outer ring from turning in its seat

SKF manufactures TDO design bearings in many variants ([table 1, page 672](#)).

Fig. 12

Matched bearings arranged in tandem

Fig. 13

TDO design

Fig. 14

TDI design

TDI design bearings

- have two outer rings (cups) and one double row inner ring with two roller and cage assemblies (double cone), usually with an intermediate ring between the two outer rings (fig. 14, page 671)
- have rows of rollers arranged face-to-face (load lines converge toward the bearing axis)
- are available open or capped with shields or seals
  - HNBR or FKM contact seal on both sides
- are ready-to-mount units, manufactured with the predetermined axial clearance or preload
- are designed primarily for use as locating bearings
- are available with a helical groove in the bore and/or lubrication grooves in the side faces of the bearing rings (fig. 15):
  - where a loose fit on the shaft is needed, these grooves counteract the disadvantage of a loose fit
  - when the inner ring turns on its seat under load, these grease-filled grooves enable lubricant to be supplied between the inner ring and seat surfaces
  - in addition, the grooves can absorb wear particles

SKF manufactures TDI design bearings in many variants (table 2).

**⚠ WARNING**

Seals made of FKM (fluoro rubber) exposed to an open flame or temperatures above 300 °C (570 °F) are a health and environmental hazard! They remain dangerous even after they have cooled.

Read and follow the safety precautions on [page 197](#).

Helical groove in the bore and lubrication grooves in the side faces of the bearing rings

Table 2

## TDI design variants and characteristics

## Design variant

## Characteristics

TDI

- intermediate ring between two outer rings
- steel window-type cages

TDI.1

- intermediate ring between two outer rings
- steel pin-type cages (pierced rollers) for higher loads

TDIE

- intermediate ring between two outer rings
- steel window-type cages
- inner ring extensions at both sides
  - extensions are ground as counterface for seal lips

 TDI<sup>T</sup>

- intermediate ring between two outer rings
- tapered bore, taper 1:12
- steel window-type cages

TDIS

- steep contact angle  $\alpha$
- for applications where high axial loads in combination with radial loads occur
- intermediate ring between two outer rings
- steel window-type cages
- used in rolling mill applications with a loose fit on the roll neck and only subjected to purely axial load
- the inner ring has one or more locating slots (notches) in one or both side faces to prevent it from turning on its seat
- depending on the application, the bearings can be supplied with or without an intermediate ring between the two outer rings

TDIS.1

- steep contact angle  $\alpha$
- for applications where high axial loads in combination with radial loads occur
- intermediate ring between two outer rings
- steel pin-type cages (pierced rollers) for higher loads

TDIS.2

- self-retaining unit with a retention sleeve over the outer rings
- the outer rings are pressed into the sleeve
- the deformation of the outer rings normally resulting from heavy axial loads is considerably reduced
  - as a consequence, the stress distribution in the rolling contacts is more favourable and extends bearing service life
- the axial internal clearance is determined by the sleeve
- preloading by means of springs is unnecessary
- steep contact angle  $\alpha$
- for applications where high axial loads in combination with radial loads occur
- the simplified and economic design facilitates mounting, dismounting and also maintenance inspection routines

## 8 Tapered roller bearings

### Optional TDI design bearings composed of four-row tapered roller bearing components

On request, TDI design bearings with dimensions different from those listed in the TDI design product table can be specially created as tailored double row bearings using standard components of SKF four-row tapered roller bearings in the TQO design, but without intermediate rings (TQO design, [skf.com/go/17000-8-9](https://skf.com/go/17000-8-9)). For example, it is possible to combine standard components as follows (fig. 16):

- two single row outer rings (cups)
- one double row inner ring (double cone)
- two roller and cage assemblies

This option may be advantageous as regards both price and delivery time and should be considered if sealed double row bearings are required, although this will require a non-standard inner ring. For details about this option, contact the SKF application engineering service.

### Variants/features

SKF manufactures TDO and TDI design bearings in many variants and with different features. Bearing-related design variants and features are identified in the [product tables, page 762](#), under Design variant/feature. For other sizes, design variants or feature combinations not listed in the product tables, contact SKF. Design variants and features are identified by the following characters within designation suffixes:

#### Design variants

- E** Extended inner ring
- N** Without intermediate ring
- S** Steep contact angle  $\alpha$
- T** Tapered bore, taper 1:12
- .1** Steel pin-type cages and pierced rollers
- .2** Retention sleeve over the outer rings

#### Features

(TDO → [fig. 17](#), TDI → [fig. 18](#))

- C** Outer ring with blind hole to prevent, together with a cylindrical pin, the outer ring from turning in its seat
- D** Outer ring with annular groove and lubrication holes (TDO), inner ring with annular groove and lubrication holes (TDI)
- D0** Outer ring with annular groove and lubrication holes, without intermediate ring between the inner rings
- D2** Outer ring with annular groove and lubrication holes, intermediate ring with lubrication holes or lubrication grooves between the inner rings
- D3** Outer ring with annular groove and lubrication holes, intermediate ring with annular groove and lubrication holes or lubrication grooves between the inner rings
- G** Helical groove in the inner ring bore
- N** Two locating slots (notches) at 180° in one side face of the inner ring
- N1** One locating slot in each side face of the inner ring, at 180° to slot in opposite side face
- N2** Two locating slots at 180° in both side faces of the inner ring, at 90° to slots in opposite side face
- TN9** Glass fibre reinforced PA66 cage
- V** Contact seals on both sides
- W** Lubrication grooves in the side faces of the bearing rings
- W1** Lubrication grooves in the side faces of the inner ring(s)
- W0** Lubrication grooves in the side faces of the outer ring(s)
- X** Bearings with retention sleeve with annular groove and lubrication holes over the outer rings (TDI, replaced by design variant .2)

- XD** Outer ring with lubrication holes (TDO)
- Y** Bearing without intermediate ring between the outer rings
- Y2** Intermediate ring with annular groove and lubrication holes between the outer rings (TDI)
- Z** Sheet steel shield on both sides

# SKF Explorer bearings

SKF continuously expands its assortment of SKF Explorer bearings (page 7). In addition to the existing SKF Explorer tapered roller bearings (product tables, page 694), SKF can also manufacture basic design tapered roller bearings as SKF Explorer bearings, on request. These SKF Explorer tapered roller bearings are identified by the designation suffix PEX.

## Cages

SKF single row and matched tapered roller bearings are fitted with one, double row tapered roller bearings are fitted with two of the cages shown in table 3. The standard stamped steel cage is not identified in the bearing designation. If non-standard cages are required, check availability prior to ordering.

When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For information about the suitability of cages, refer to Cages, page 187.

Table 3

### Cages for tapered roller bearings

#### Single row and matched bearings

#### Double row bearings

| Cage Type | Single row and matched bearings |                              |                              | Double row bearings         |                           |                              |
|-----------|---------------------------------|------------------------------|------------------------------|-----------------------------|---------------------------|------------------------------|
|           | Window-type, roller centred     |                              |                              | Window-type, roller centred | Pin-type, pierced rollers | Window-type, roller centred  |
| Material  | Stamped steel                   | PA66, glass fibre reinforced | PEEK, glass fibre reinforced | Stamped steel               | Machined steel            | PA66, glass fibre reinforced |
| Suffix    | –                               | TN9                          | TNH                          | –                           | .1                        | TN9                          |

# Bearing data

|                                                       | Metric single row bearings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Inch single row bearings                                                                                                                                                                                                                                                    |

$\Delta_{TsD}$  designates the deviation of a single total abutment width of a matched bearing set from the nominal.

Table 6

Axial internal clearance of matched metric single row tapered roller bearings, arranged face-to-face or back-to-back

| Bore diameter<br>d |     | Axial internal clearance of matched bearings in the series |      |      |      |      |      |      |      |          |      |      |      |          |      |      |      |
|--------------------|-----|------------------------------------------------------------|------|------|------|------|------|------|------|----------|------|------|------|----------|------|------|------|

<sup>1)</sup> When determining the axial load  $F_a$ , refer to Calculating the axial load for bearings mounted singly or paired in tandem.

## Calculating the axial load for bearings mounted singly or paired in tandem

When a radial load is applied to a single row tapered roller bearing, the load is transmitted from one raceway to the other at an angle to the bearing axis and an internal axial load is induced. This should be considered when calculating the equivalent bearing loads for bearing applications consisting of two single bearing arrangements and/or bearing pairs arranged in tandem.

Necessary equations for various bearing applications and load cases are provided in [table 7, page 682](#). The equations are valid under the following conditions:

- the bearings are adjusted against each other to practically zero clearance, but without any preload
- bearing A is subjected to a radial load  $F_{rA}$  and bearing B to a radial load  $F_{rB}$
- both  $F_{rA}$  and  $F_{rB}$  are always considered positive, even when they act in a direction opposite to that shown in the figures
- the radial loads act at the pressure centres of the bearings (distance  $a$ , refer to [product tables, page 694](#))

$K_a$  is the external axial force acting on the shaft or on the housing. Load cases 1c and 2c are also valid when  $K_a = 0$ .

Values of the calculation factor  $Y$  are listed in the product tables.

Table 7

## Calculating the radial load acting on matched bearings

When matched tapered roller bearings, arranged face-to-face or back-to-back, are mounted together with a third bearing, the bearing arrangement is statically indeterminate. In these cases, the radial load  $F_r$  acting on the bearing pair must be calculated first.

### Matched bearings arranged face-to-face

For matched bearings, where two bearings are arranged face-to-face (fig. 19), it can be assumed that the radial load acts at the geometric centre of the matched bearings, as the distance between the pressure centres of the two bearings is short when compared with the distance between the geometric centres of the set and the other bearing. In this case, it can be assumed that the bearing arrangement is statically determined.

Fig. 19

Matched bearings arranged face-to-face, radial load

## 8 Tapered roller bearings

### Matched bearings arranged back-to-back

The distance  $a$  between the pressure centres of two matched bearings arranged back-to-back is significant when compared with the distance  $L$  between the geometric centres of the matched bearings and the other bearing ([fig. 20](#)). Therefore, it is necessary to calculate the magnitude of the load acting on the bearing pair and also the distance  $a_1$  at which the load acts. The magnitude of the radial load can be obtained using:

$$F_r = \frac{L}{L - a_1} K_r$$

where

$F_r$  = radial load acting on a bearing pair [kN]

$K_r$  = radial force acting on the shaft [kN]

$L$  = distance between the geometric centres of the two bearing positions [mm]

$L_1$  = distance between the centre of bearing position I and the point of action of the force  $K_r$  [mm]

$a$  = distance between the bearing pressure centres [mm] ([product table, page 754](#))

$a_1$  = distance between the geometric centre of the matched bearings and the point of action of the radial load  $F_r$  [mm]

- [diagram 2](#)

- calculation factor  $Y_2$ , [product table](#)

The distance  $a_1$  can be determined from [diagram 2](#) by making an initial assumption for  $F_r$  and if necessary followed by several iterative calculations.

Fig. 20

Matched bearings arranged back-to-back, radial load

Diagram 2

Distance of point of action of radial load

## Comparative load ratings for double row tapered roller bearings

For rolling mill applications, load ratings are not necessarily calculated according to ISO 281. Instead, they are often calculated by a different method based on a rating life of 90 million revolutions (500 r/min for 3 000 operating hours). Therefore, for double row tapered roller bearings these comparative load ratings are provided in the product tables because a direct comparison between the comparative and ISO load ratings is not possible, even if the comparative ratings are converted for 1 million revolutions (ISO life definition).

These comparative load ratings may not be used to calculate an ISO rating life. They may only be used together with the comparative rating life and equivalent load equations specified as follows:

$$L_{F10} = 90 \left( \frac{C_F W^{10/3}}{P_F} \right)$$

or

$$L_{F10h} = \left( \frac{C_F W^{10/3}}{P_F} \right) \left( \frac{1\,500\,000}{n} \right)$$

where

$L_{F10}$  = comparative rating life [million revolutions]

$L_{F10h}$  = comparative rating life [operating hours]

$C_F$  = comparative dynamic load rating to give a rating life of 90 million revolutions [kN] ([product tables](#), [page 762](#))

$P_F$  = comparative equivalent dynamic bearing load [kN] ([table 8](#), [page 686](#))

$n$  = constant rotational speed [r/min]

## Temperature limits

The permissible operating temperature for tapered roller bearings can be limited by:

- the dimensional stability of the bearing rings and rollers
- the cages
- the seals
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

### Bearing rings and rollers

SKF single row and matched tapered roller bearings are heat stabilized up to:

- $D \leq 160 \text{ mm} \rightarrow 120 \text{ }^\circ\text{C} (250 \text{ }^\circ\text{F})$
- $D > 160 \text{ mm} \rightarrow 150 \text{ }^\circ\text{C} (300 \text{ }^\circ\text{F})$

SKF double row tapered roller bearings are heat stabilized up to  $150 \text{ }^\circ\text{C} (300 \text{ }^\circ\text{F})$ .

### Seals

The permissible operating temperature for seals depends on the seal material:

- HNBR:  $-40$  to  $+150 \text{ }^\circ\text{C} (-40 \text{ to } +300 \text{ }^\circ\text{F})$
- FKM:  $-30$  to  $+200 \text{ }^\circ\text{C} (-20 \text{ to } +390 \text{ }^\circ\text{F})$

Typically, temperature peaks are at the seal lip.

### Cages

Steel or PEEK cages can be used at the same operating temperatures as the bearing rings and rollers. For temperature limits of cages made of other polymer materials, refer to *Polymer cages*, [page 188](#).

### Lubricants

For temperature limits of SKF greases, refer to *Selecting a suitable SKF grease*, [page 116](#).

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept ([page 117](#)).

# Permissible speed

The speed ratings in the [product tables](#) indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed*, [page 130](#).

Values of the thrust factor  $K_L$  are listed as  $K$  in the product tables.

For load cases 1a) and 1b), the load rating for one roller row needs to be applied when using  $P_{FL}$ . The load rating for one roller row can be obtained from

$$C_{F(row)} = 0,58 C_{F(bearing)}$$

# Design considerations

## Single row and matched tapered roller bearings

Single row tapered roller bearings must be used either with a second bearing (fig. 21) or as a matched pair (fig. 10, page 670, and fig. 11, page 670). The bearings must be adjusted against each other until the requisite clearance or preload is obtained (*Selecting preload*, page 186).

When the operating clearance in a bearing arrangement is too large, the load carrying capacity of both bearings cannot be fully utilized. Excessive preload increases friction, which increases the amount of frictional heat and reduces bearing service life.

### Adjustment procedure

When adjusting tapered roller bearings against each other, the bearings must be rotated so that the rollers assume their correct position, i.e. the large end face of the rollers must be in contact with the guide flange.

## Fits

### Inch bearings

In contrast to metric bearings, which are machined to a minus tolerance, inch bearings are machined to a plus tolerance (table 9, page 45). Therefore, the deviations for shaft and housing diameters for metric bearings are not applicable. Suitable shaft and housing fits for inch tapered roller bearings are provided in table 9, page 688, and table 10, page 689. These fits are valid for bearings with Normal tolerances in typical applications.

### Matched bearings

The axial internal clearance of matched bearings arranged face-to-face or back-to-back (table 6, page 679) provides an appropriate operating clearance when the bearings are mounted on shafts machined to:

- $d \leq 50 \text{ mm}$  → m5<sup>Ⓔ</sup>
- $50 \text{ mm} < d \leq 140 \text{ mm}$  → m6<sup>Ⓔ</sup>
- $140 \text{ mm} < d \leq 200 \text{ mm}$  → n6<sup>Ⓔ</sup>
- $d > 200 \text{ mm}$  → p6<sup>Ⓔ</sup>

SKF recommends these shaft seat tolerance classes for rotating loads on the inner ring where  $P \leq 0,06 C$ . If tighter fits are selected, be sure that the bearings are not preloaded and are able to rotate freely. The reduction of internal clearance caused by axial locating forces should also be taken into consideration.

For stationary outer ring loads, SKF recommends housing bore tolerance classes J6<sup>Ⓔ</sup> or H7<sup>Ⓔ</sup>.

For higher requirements on accuracy, contact the SKF application engineering service.

# Mounting

## Double row tapered roller bearings

Depending on their design, components of double row tapered roller bearings can also be mounted separately. The individual rings of one bearing must be mounted in the correct order and position. They must also not be mixed with those of another bearing when several bearings are mounted at the same time. Therefore, some precautions have been taken to ease mounting:

- Components of one bearing are marked with letters that indicate their correct order and position (fig. 22).
- All components of one bearing are marked with the same serial number.

Special care should be taken not to deform or compress the relatively thin-walled intermediate rings when mounting smaller TDI design bearings. This can happen, for example, when tightening the cover screws and can have a negative impact on the axial clearance or the preload. Therefore, SKF recommends applying a cover with a centring spigot that is appropriate to the widths of the bearing and the housing seat.

If the knowledge and experience required to mount double row tapered roller bearings is unavailable, especially where large bearings are concerned, SKF recommends that the assistance of SKF service personnel be requested. Further details of the SKF mounting service are available on request.

## Load zone

In the majority of rolling mill applications, the direction of a radial load is constant. Depending on the ratio between axial and radial loads, usually only approximately one quarter of the outer ring raceway is under load. Therefore (fig. 23):

- Outer rings are divided into four zones identified by a marking I to IV on the outer ring side faces, on request.
- Markings for zone I are also joined by a line across the outside surface.
- For initial mounting, zone I (line across the outside surface) should be positioned in the direction of the load.
- Depending on the operating conditions, after a period of service the outer rings should be turned through 90° so that a new (the next) zone becomes the loaded zone.

Fig. 22

Components are marked with letters that indicate their correct order and position

Fig. 23

Side face of the outer ring divided into four zones by a marking I to IV and marking of zone I by a line across the outside surface

# Bearing designations

## Metric bearings

The designations of metric tapered roller bearings follow one of the following principles:

- The series designations in accordance with ISO 355 consist of a digit and two letters. The digit represents the contact angle. The two letters represent the diameter and width series, respectively. This is followed by a three-digit bore diameter  $d$  [mm]. The basic designations of SKF tapered roller bearings start with the letter T, e.g. T2ED 045.
- Designations established prior to 1977 are based on the system shown under *Basic designations*, [page 31](#), e.g. 32206 ([table 4](#), [page 30](#)).
- Metric bearings with the designation prefix J follow the ABMA designation system, which is used for inch bearings (ANSI/ABMA Std. 19.1).

## Inch bearings

Inch tapered roller bearing designations are in accordance with ANSI/ABMA Std. 19.2.

Within a series:

- roller and cage assemblies are equal but the inner and outer rings can have different sizes and designs
- any inner ring with roller and cage assembly (cone) can be assembled with any outer ring (cup)

General:

- Cup and cone have individual designations and can be supplied separately ([fig. 24](#)).
- The designations of cups and cones, as well as the series, consist of a three- to six-digit number, which may be prefixed to characterize a bearing series from extra-light to extra-heavy.
- The complete bearing designation is an abbreviated combination of cone and cup designations. It consists of the cone designation followed by the complete or parts of the cup designation, separated by an oblique stroke ([table 11](#)).

Fig. 24

Separately packed components

Table 11

### Examples of inch tapered roller bearing designations

| Complete bearing            | Cone     | Cup      | Series   |

## Prefixes

|   |                                                                            |
|---|----------------------------------------------------------------------------|
| J | Metric bearing following the ABMA designation system (ANSI/ABMA Std. 19.2) |
| T | Metric bearing in accordance with ISO 355                                  |

## Basic designation

Refer to Bearing designations, [page 691](#) or drawing number identification.

|              |                                                                              |
|--------------|------------------------------------------------------------------------------|
| BT2-<br>BT2B | Drawing number prefixes that may precede a four- or six-digit drawing number |
|--------------|------------------------------------------------------------------------------|

## Suffixes

### Group 1: Internal design

|         |                                                                  |
|---------|------------------------------------------------------------------|
| A, C, D | Deviating or modified internal design, combinations are possible |
| B       | Steep contact angle                                              |

### Group 2: External design (seals, grooves, etc)

|     |                                                                                                                          |
|-----|--------------------------------------------------------------------------------------------------------------------------|
| E   | SKF Explorer bearing (only for double row bearings)                                                                      |
| G   | Helical groove in the inner ring bore (only for double row bearings)                                                     |
| R   | Flanged outer ring                                                                                                       |
| T.. | A number immediately following the T identifies the total width of matched bearings, arranged back-to-back or in tandem. |
| X   | Boundary dimensions changed to conform to ISO                                                                            |

### Group 3: Cage design

|     |                                                  |
|-----|--------------------------------------------------|
| TN9 | Glass fibre reinforced PA66 cage, roller centred |
| TNH | Glass fibre reinforced PEEK cage, roller centred |

### Group 4.1: Materials, heat treatment

|     |                                                        |
|-----|--------------------------------------------------------|
| HA1 | Case-hardened inner and outer rings                    |
| HA2 | Case-hardened outer ring                               |
| HA3 | Case-hardened inner ring                               |
| HA4 | Case-hardened inner and outer rings and rollers        |
| HA5 | Case-hardened rollers                                  |
| HA6 | Case-hardened outer ring(s) and rollers                |
| HA7 | Case-hardened inner ring(s) and rollers                |
| HB1 | Bainite-hardened inner and outer rings                 |
| HB2 | Bainite-hardened outer ring(s)                         |
| HN3 | Inner ring with special surface heat treatment         |
| L4B | Bearing rings and rollers with special surface coating |

### Group 4.2: Accuracy, clearance, preload, quiet running

|      |                                                                                                                                                                                |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /1   | Deviating width tolerances of cups and cones for inch bearings ( <a href="#">table 4, page 678</a> )                                                                           |
| /-1  |                                                                                                                                                                                |
| to   |                                                                                                                                                                                |
| /-3  |                                                                                                                                                                                |
| /4   |                                                                                                                                                                                |
| C... | Axial internal clearance (only for double row bearings)<br>The three- or four-digit number immediately following the C is the mean axial internal clearance in $\mu\text{m}$ . |
| CL0  | Geometrical tolerances to ABMA tolerance class 0 (inch bearing)                                                                                                                |
| CL00 | Geometrical tolerances to ABMA tolerance class 00 (inch bearing)                                                                                                               |
| P5   | Geometrical tolerances to P5 tolerance class                                                                                                                                   |
| U..  | U combined with a one- or two-digit number identifies tighter total width tolerance, e.g.:<br>U2 $\rightarrow$ +5/0 $\mu\text{m}$<br>U4 $\rightarrow$ +10/0 $\mu\text{m}$      |
| W    | Modified ring width tolerance to +5/0 $\mu\text{m}$                                                                                                                            |

| Group 4 |     |     |     |     |     |
|---------|-----|-----|-----|-----|-----|
| 4.1     | 4.2 | 4.3 | 4.4 | 4.5 | 4.6 |

**Group 4.6: Other variants**

|       |                                                                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CL7A  | Pinion bearing, superseded by CL7C                                                                                                                                            |
| CL7C  | High-performance design                                                                                                                                                       |
| CLN   | Tighter tolerances for ring widths and total (abutment) width in accordance with ISO tolerance class 6X                                                                       |
| PEX   | SKF Explorer bearing, used only when same-sized basic design bearing and SKF Explorer bearing are available                                                                   |
| V001  | CL7C and /2                                                                                                                                                                   |
| VA321 | Optimized internal design                                                                                                                                                     |
| VA606 | Crowned raceway on the outer ring, logarithmic profile on the inner ring and special heat treatment                                                                           |
| VA607 | Same as VA606, but other outside diameter tolerance                                                                                                                           |
| VA901 | Contact seal on both sides, outer ring side faces with lubrication grooves, sealing ring between the inner rings                                                              |
| VA902 | Contact seal on both sides, without relubrication features, sealing ring between the inner rings                                                                              |

| VQ507 | CL7C with tighter or shifted tolerance range for the outside diameter                                                                                                         |
| VQ523 | CL7C with tighter inner ring width tolerance and tighter or shifted tolerance range for the outside diameter                                                                  |
| VQ601 | Geometrical tolerances to ABMA tolerance class 0 (inch bearing)                                                                                                               |

**Group 4.5: Lubrication****Group 4.4: Stabilization****Group 4.3: Bearing sets, matched bearings**

|      |                                                                                                                                                                                                                        |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB.. | Two bearings matched for mounting back-to-back. A number immediately following the DB identifies the design of the ring spacers.                                                                                       |
| DF.. | Two bearings matched for mounting face-to-face. A number immediately following the DF identifies the design of the ring spacer.                                                                                        |
| DT.. | Two bearings matched for mounting in tandem. A number immediately following the DT identifies the design of the ring spacers.                                                                                          |
| C... | Special clearance<br>The two- or three-digit number immediately following the C is the mean axial internal clearance in $\mu\text{m}$ . The range remains the same as specified in <a href="#">table 6, page 679</a> . |

In addition to their designation, double row bearings are also identified by their design variants/features ([product tables, page 762](#)). Some of these features may not be part of the bearing designation, but are always part of the design variants/features ([Variants/features, page 674](#)).

## 8.1 Metric single row tapered roller bearings
